

Getting to Know the UI

The UI allows you to monitor your data, resolve issues, manage your assets, and troubleshoot your Gridscale X Meter Data Management environment.

The UI experience is centered around reusable elements. The out-of-the-box applications have pages that include elements from that application, but it is also possible for some pages to use elements from different applications. All applications share the same application shell and the same common behaviors.

Accessing the UI

The UI is accessed through a URL, such as:

```
https://<current server hostname>:9964/appshell/ui/homepage
```

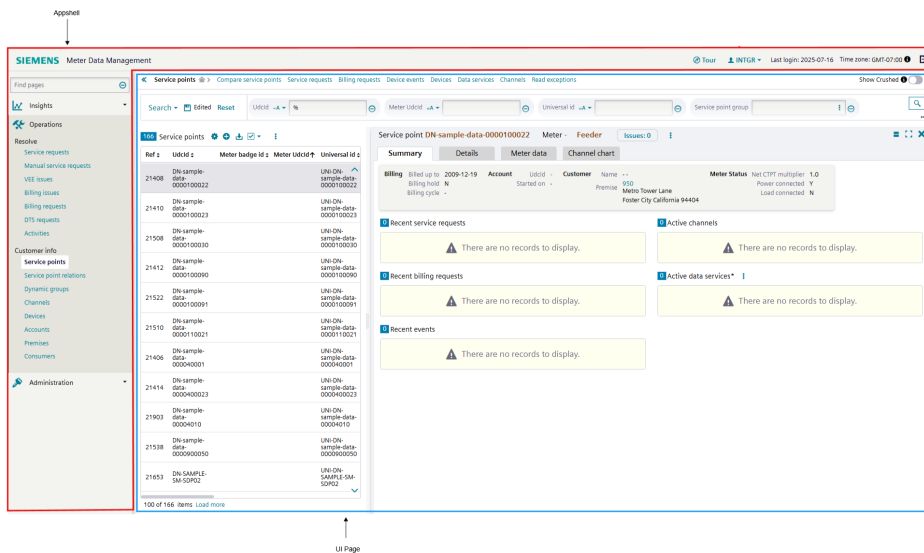

The specific URL information as well as the user names and passwords are provided to you by your Gridscale X Meter Data Management administrator. See [Logging In and Out](#).

The UI is best viewed with a minimum screen resolution of 1280 x 1024.

UI Elements

The UI structure has a persistent application shell (or Appshell for short) and variable UI pages. The Appshell provides a framework for the UI pages. Selecting a page in the sitemap displays it as the UI page.

The Appshell includes the fixed elements within the red border in the following figure. The UI pages appear in the area outlined in blue, the content of which changes to reflect the page selected in the sitemap on the left.

The elements of the Appshell and UI pages are described in the following topics.

- [Application Shell](#)
- [UI Elements and Behaviors](#)
